

```
-- Normalization:-
-- Normalization is the process of organizing data in a database to reduce
redundancy
-- and improve data integrity.

-- goals of normalization:-
-- 1) Reduce data redundancy(duplicate data).
-- 2) Improve data consistency.
-- 3) Avoid duplicate anomalies.
-- 4) Improve data integrity.
-- 5) Make database easier to maintain.

-- Types of normalization:-
-- 1NF, 2NF, 3NF, BCNF(3.5NF), 4NF, 5NF, 6NF

-- When we reach 3NF that means our database have been normalized
-- There are mainly three normal forms
-- 1) 1NF(first normal form)
-- 2) 2NF(second normal form)
-- 3) 3NF(Third normal form)

-- -----
-- 1) 1NF:-
-- For a table to be in 1NF you have to follow some rules:-
-- a) All the column should contain atomic values.
-- b) No repeating groups
-- c) Each record is unique(primary key)

-- 2) 2NF:-
-- 1) Should be in 1NF.
-- 2) No Partial dependency.

-- Partial dependecny occurs when a non key attribute depends
-- only on part of a composite primary key and not the whole key.

-- 3) 3NF:-
-- 1) Should be in 2NF
-- 2) There are no transitive dependencies.

-- Transitive dependency occurs when a Non key attribute depends
-- on another non key attribute instead of the primary key.
```
